Light Company

PHYSICAL EVALUATION INFRASTRUCTURE

Prism

More signal per physical trial.

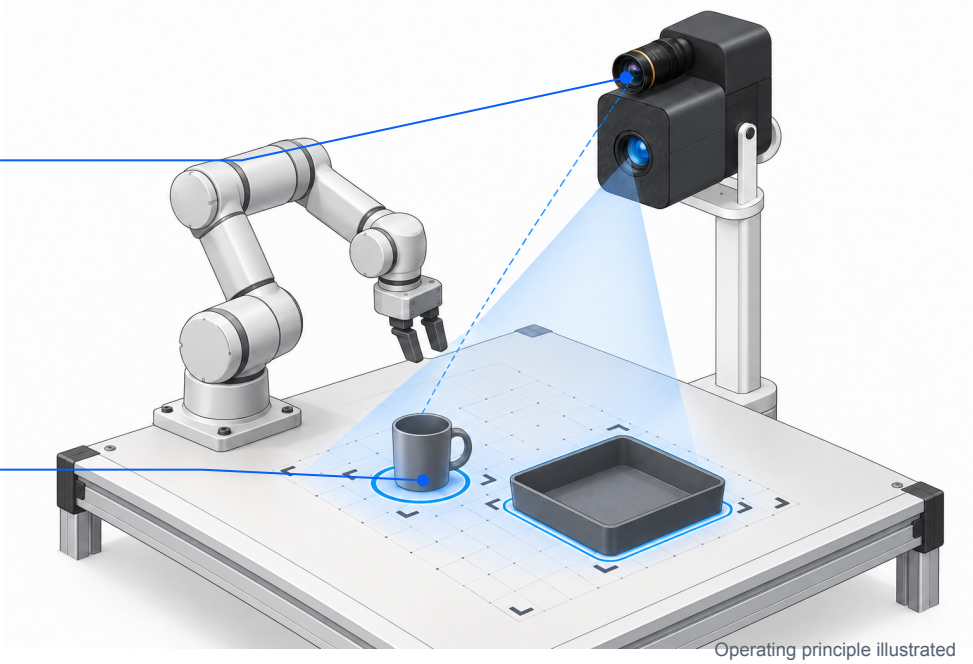

Bring your test code into the workcell. Define the case, verify the physical state, and connect the outcome to the conditions that produced it.

01 / VISUAL INTELLIGENCE

Recognize objects and check their pose, occlusion, and placement tolerance against the intended test.

02 / PROJECTED GUIDANCE

Turn software-defined conditions into cues on the real surface. Guide each reset and verify the scene before the trial.

Operating principle illustrated

SDK + TEST CASES

Upload placements from your code, generate cases, and repeat them across policies and calibrated stations.

OUTCOMES + SCORING

Link trial outcomes from your evaluator or image-based task scoring to the verified starting state.

FAILURE + COVERAGE MAPS

See where a policy succeeds, fails, or lacks coverage. Return to those conditions after the next update.

FEWER TRIALS TO GET POLICY FEEDBACK

300 → ~30

10x fewer evaluations in a robotics lab

LESS VARIATION BETWEEN EVALUATIONS

40% → 3%

92.5% lower evaluation variability

Pilot results: Enact, a robotics lab, reduced runs from 300-400 to about 30 (10x uses 300).
New Theory: evaluation variability fell from 40% to 3% over 30 days. Separate customer workflows.

Bring Prism into your evaluation loop.
